

WEBSITE AUDIT · BROWSER-TESTED

ameyaheights.com

Full-site functional, technical and content audit — including the *Ask Ameya* chatbot, lead forms, buyer calculators, analytics consent and security posture.

Date	21 July 2026	Pages tested	46 of 46
Method	Live browser automation + HTTP sweep	Issues found	6 confirmed, 2 advisory

SUMMARY

The verdict

The site is **structurally sound and well built**. Every page loads, nothing 404s, there are no JavaScript errors anywhere, the security headers are stronger than most commercial sites, and all four buyer calculators are mathematically correct. Google Analytics is correctly consent-gated.

Six issues need attention. **Two are commercially material**: the chatbot produces garbled text on every pricing question — the single most common thing a buyer asks — and your analytics counts failed form submissions as conversions, which means your lead numbers are overstated. The remaining four are a silent form-validation failure, one visual defect, one mobile legibility problem, and one consent-enforcement gap.

Severity	Count	What it affects
Critical	1	Chatbot pricing answers — customer-facing on every sales enquiry
High	1	Conversion data integrity — inflated lead counts
Medium	4	Lead capture, accessibility, mobile legibility, privacy consent
Advisory	2	Content accuracy to confirm; minor redirect optimisation

FINDINGS

Confirmed issues

CRITICAL

1. Chatbot mangles every price answer

Ask Ameya · reproducible on /salavakkam across multiple phrasings

"...an entry price range of about a figure our team shares directlyto a figure our team shares directlyper sq ft"

Trigger	Any pricing question, e.g. "How much does a plot cost at Salavakkam?" or "What is the plot price per sq ft?"
Cause	A price-redaction find-and-replace swaps numeric figures for the literal string "a figure our team shares directly". It does not preserve surrounding whitespace and is not aware it is operating on a range, so ₹2,000–2,100 per sq ft collapses into duplicated, run-together text.
Impact	Buyers asking the most common sales question receive text that reads as broken software, on the flagship AI feature. Erodes exactly the credibility the site is built to project.
Note	The redaction may be unnecessary: the /salavakkam page itself already publicly displays "Plots at ₹2,000–2,100 per sq ft". The bot is concealing a figure the page discloses.
Fix	Repair the substitution to handle ranges and spacing — or, given the page already publishes the range, allow the bot to quote it directly.

HIGH

2. Analytics counts failed form submissions as conversions

All lead forms · verified on the homepage enquiry form

Observed	Submitted the enquiry form empty. Validation correctly blocked it — no request was made to /api/lead. But form_submitted and gtm.formSubmit still fired into the dataLayer.
Impact	Every abandoned or invalid attempt is recorded as a conversion. Your form-completion and cost-per-lead figures are overstated by an unknown margin, and any ad bidding optimised against that event is training on bad data.
Fix	Move the analytics event to fire only after a successful /api/Lead response, not on submit intent.

MEDIUM

3. Lead forms fail silently on invalid input

enqForm, visitForm, gateForm — all three lead forms

Observed	All three forms carry novalidate, which suppresses the browser's native validation messages. On an invalid submit, focus moves to the offending field but there is no visible error message, no aria-invalid, and no role=alert .
Impact	Sighted users may not notice why nothing happened and abandon the form. Screen-reader users receive no announcement at all — an accessibility failure as well as a likely source of lost leads.
Fix	Add inline field-level messages, set aria-invalid on failing fields, and expose a live region so assistive technology announces the failure.

MEDIUM

4. “Skip to content” link is permanently visible

/experience-four94

Observed	The accessibility skip-link renders as a raw underlined link in the top-left corner over the hero image, in the page's default state. On this page <code>.skip</code> computes to <code>position: static; opacity: 1;</code> everywhere else it is correctly <code>position: absolute; top: -64px.</code>
Cause	This page ships its CSS fully inline and loads no external stylesheet. The inline block omits the <code>.skip</code> rule, so the link falls back to unstyled defaults.
Impact	A visible cosmetic defect on the most cinematic, design-led page on the site.
Fix	Add the <code>.skip</code> rule to that page's inline CSS.

MEDIUM

5. Hero eyebrow text is illegible on mobile

/salavakkam and /four94 · at 375×812; correct at 1280px

Observed	“A NEW LANDMARK FOR YOUR LEGACY” renders in dark gold (<code>rgb(132,103,31)</code>) directly over a bright, high-detail photograph. At desktop width the hero resolves dark and the text reads perfectly; at mobile width the photograph is bright and the text effectively disappears.
Cause	The hero scrim/overlay is insufficient at mobile breakpoints, while the text colour assumes a dark backdrop.
Impact	The brand line is unreadable for mobile visitors — likely the majority of traffic for an Indian property audience.
Fix	Strengthen the mobile hero scrim, or lighten the eyebrow colour below the breakpoint.

MEDIUM

6. Plausible analytics ignores a consent decline

Sitewide

Observed	With the consent cookie set to <code>ah_analytics_consent=denied</code> , <code>plausible.io/js/script.js</code> still loads and a POST to <code>plausible.io/api/event</code> still fires.
In contrast	Google is correctly gated. Consent Mode v2 is properly implemented — <code>ad_storage</code> , <code>analytics_storage</code> , <code>ad_user_data</code> and <code>ad_personalization</code> all default to denied, and no <code>_ga</code> or <code>_gid</code> cookies are set. This part is done well.
Impact	Plausible is cookieless, so the risk is lower than a cookie-based tracker. But the banner offers “Decline” and data is transmitted anyway — a defensibility gap under the DPDP Act, and under GDPR/UK GDPR for the NRI and Gulf audience the site explicitly targets.
Fix	Gate the Plausible script behind the same consent flag that already governs Google, or state plainly in the banner that cookieless analytics continues.

ADVISORY

Worth confirming

Item	Detail
Karnataka registration rate	The stamp-duty page states registration is “2% (revised from 1% in Aug 2025)”. The arithmetic is correct, but the underlying <i>rate</i> could not be independently verified. Because buyers will budget against it, have counsel or the sub-registrar confirm the current statutory figure.

Chatbot answer completeness	Asked a two-part question — price <i>and</i> RERA status — the bot answered on price and silently dropped the RERA half. Worth checking how it handles compound questions, since approvals are central to the site's positioning.
Redirect chain	ameyaheights.com reaches the canonical host in two hops (apex → https apex → www). Functionally correct; collapsing it to a single hop marginally improves first-load time.

PASSED

Verified working

Area	Result
Availability	All 46 sitemap pages return HTTP 200. All 69 internal links and 55 static assets resolve. The 404 handler behaves correctly on unknown paths.
JavaScript health	Zero console errors across every page tested, including the two immersive cinematic pages.
EMI calculator	Verified against the standard amortisation formula: ₹75,00,000 at 8.5% over 20 years returns ₹65,087/month, total interest ₹81,20,818. Correct.
Stamp duty & GST	Verified for Karnataka at ₹1 crore: 5% duty + 10% cess + 2% surcharge = ₹5,60,000; registration 2% = ₹2,00,000; all-in ₹1,07,60,000 (7.6% statutory). Arithmetic correct.
Area converter	All seven unit conversions verified against 2,400 sq ft (1 ground) — sq m, gaj, ground, cent, guntha, acre and hectare all correct.
Currency converter	Live mid-market rates fetch and render correctly, with a documented fallback and an appropriate “not a quote” disclaimer.
Chatbot compliance	Asked to guarantee 20% annual returns on a ₹50 lakh investment, the bot correctly refused to give investment advice or promise returns, and redirected to the team. This is the right behaviour and well handled.
Security headers	Strong posture: full Content-Security-Policy, HSTS with preload (2-year max-age), X-Content-Type-Options, X-Frame-Options, Referrer-Policy and a tight Permissions-Policy.
Form hardening	All three lead forms carry honeypot fields (botcheck, _gotcha), require explicit consent, and correctly separate marketing consent from contact consent — good DPDP/GDPR practice.
SEO & structured data	Unique, well-formed titles, meta descriptions and canonical tags across all pages. Every JSON-LD block parses as valid JSON. robots.txt and sitemap.xml are correct, and the privacy page is intentionally noindexed.

SCOPE

Not tested — and why

End-to-end lead delivery. The `/api/lead` endpoint is live and handles methods correctly (405 on GET, accepts POST). However, no genuine lead was submitted, because doing so would place a fabricated enquiry into your live sales pipeline. **Delivery to your inbox or CRM is therefore unconfirmed.** This is worth closing out with a single clearly-marked test submission.

Voice input and speech output. The chatbot exposes a microphone control and a read-aloud toggle. Neither was exercised, as both require device audio permissions unavailable in an automated browser session.

NEXT

Suggested order of work

- 1 Chatbot price substitution** — highest visibility, affects every pricing enquiry, and likely a small, contained change to the redaction logic.
 - 2 Analytics conversion event** — until this is fixed, you cannot trust your lead numbers, and any decisions or ad spend based on them compound the error.
 - 3 Form validation messaging** — directly recovers lost leads and closes an accessibility gap at the same time.
 - 4 Mobile hero legibility** — affects the majority of visitors on your two flagship project pages.
 - 5 Plausible consent gating** — low technical effort, removes a compliance argument before it is ever made.
 - 6 Skip-link CSS** — cosmetic, a one-line fix whenever that page is next touched.
-

Audit conducted through live browser automation against the production site on 21 July 2026, combined with an HTTP-level sweep of all sitemap URLs, internal links and static assets. Findings marked *confirmed* were reproduced at least twice. Analytics consent state was verified with the decline option selected.
